My business idea, RideOut, is an AI-powered website that helps motorcycle riders plan the best possible ride using GPS, maps, and rider preferences. The AI would build routes based on what the rider actually wants such as twisty roads, scenic views, fewer stoplights, or staying away from rough roads. Riders could enter their starting point, destination, or just “make me a 2 hour loop”. It would also include places to stop for gas/food and ride times. The AI would also use real time data like traffic, road closures, construction, and weather to reroute if needed and send alerts before the ride. In the future the website could transition into a mobile app so the rider can use it while actively riding. Overall, this website would make ride planning easier, make rides safer, and more enjoyable.
